

Abstract

In recent days vehicle theft has become a major issue in the society. It can be reduced only by placing camera at each and every corner of the streets, roads and houses which requires a lot and lots of expensive and man work. Our idea's main beneficiaries are the vehicle owners including cars, trucks etc... If the owner of a vehicle comes to know that his/her is stalled by someone and they no need to get panic that he/she can control the car (i.e. can stop the car or allow to run) from the place where he/she notices that the car is stalled by a thief. Our device also helps to know the moving location of the car through a message from the device that is fitted in the car's engine
